Lab 5: Diffie-Hellman, Public Key, Private Key and Hashing

Part 1 Demo: http://youtu.be/3n2TMpHqE18

The hashcat version has a time-out, so enter the following command:

date -s "1 OCT 2015 18:00:00"

1 Diffie-Hellman

No	Description	Result
1	On Kali, login and get an IP address using: `sudo dhclient eth0`	What is your IP address?
2	Bob and Alice have agreed on the values: G=2879, N= 9929 Bob Select x=6, Alice selects y=9	Now calculate (using the Kali calculator): Bob's A value (G_x mod N): Alice's B value (G_Y mod N):
3	Now they exchange the values. Next calculate the shared key:	Bob's value (B_x mod N): Alice's value (A_Y mod N): Do they match? [Yes] [No]
4	If you are in the lab, select someone to share a value with. Next agree on two numbers (G and N).	Numbers for G and N: Your x value:

	You should generate a random number, and so should they. Do not tell them what your random number is. Next calculate your A value, and get them to do the same. Next exchange values.	Your A value: The B value you received: Shared key: Do they match: [Yes] [No]

2 Private Key

No	Description	Result

1	Use:
	
	`openssl list-cipher-commands`
	
	`openssl version`
		Outline five encryption methods that are supported:
		
		Outline the version of OpenSSL:

2	Using openssl and the command in the form: `openssl prime –hex 1111`	Check if the following are prime numbers: 42 [Yes][No] 1421 [Yes][No]
3	Now create a file named myfile.txt (either use Notepad or another editor). Next encrypt with aes-256-cbc `openssl enc -aes-256-cbc -in myfile.txt -out encrypted.bin`	Use following command to view the output file: `cat encrypted.bin` Is it easy to write out or transmit the output: [Yes][No]

	and enter your password.	
4	Now repeat the previous command and add the –base64 option. `openssl enc -aes-256-cbc -in myfile.txt -out encrypted.bin -base64`	Use following command to view the output file: `type encrypted.bin` Is it easy to write out or transmit the output: [Yes][No]
5	Now repeat the previous command and observe the encrypted output. `openssl enc -aes-256-cbc -in myfile.txt -out encrypted.bin -base64`	Has the output changed? [Yes][No] Why has it changed?
6	Now let's decrypt the encrypted file with the correct format: `openssl enc -d -aes-256-cbc -in encrypted.bin -pass pass:napier -base64`	Has the output been decrypted correctly? What happens when you use the wrong password?

7	If you are working in the lab, now give your secret passphrase to your neighbour, and get them to encrypt a secret message for you.
	
	To receive a file, you listen on a given port (such as Port 1234)
	
	`nc -l -p 1234 > enc.bin`
	
	And then send to a given IP address with:
	
	`nc -w 3 [IP] 1234 < enc.bin`
		Did you manage to decrypt their message? [Yes][No]

3 Public Key

No	Description	Result
1	First we need to generate a key pair with: `openssl genrsa -out private.pem 1024` This file contains both the public and the private key.	What is the type of public key method used: How long is the default key: How long did it take to generate a 1,024 bit key? View the contents of the keys.
2	Use following command to view the output file: `Cat private.pem`	What can be observed at the start and end of the file:
3	Next we view the RSA key pair: `openssl rsa -in private.pem -text -noout`	Which are the attributes of the key shown: Which number format is used to display the information on the attributes: What does the –noout option do?

4	Let's now secure the encrypted key with 3-DES: `openssl rsa -in private.pem -des3 -out key3des.pem`	
5	Next we will export the public key: `openssl rsa -in private.pem -out public.pem -outform PEM -pubout`	View the output key. What does the header and footer of the file identify?
6	Now we will encrypt with our public key: `openssl rsautl -encrypt -inkey public.pem -pubin -in myfile.txt -out file.bin`	
7	And then decrypt with our private key: `openssl rsautl -decrypt -inkey private.pem -in file.bin -out decrypted.txt`	What are the contents of decrypted.txt
8	If you are working in the lab, now give your password to your neighbour, and get them to encrypt a secret message for you.	Did you manage to decrypt their message? [Yes][No]

4 Storing keys

We have stored our keys on a key ring file (PEM). Normally we would use a digital certificate to distribute our public key. In this part of the tutorial we will create a crt digital certificate file.

No	Description	Result

1	Next create the crt file with the following:
	
	`openssl req -new -key private.pem -out cert.csr`
	
	`openssl x509 -req -in cert.csr -signkey private.pem -out server.crt`
		View the CRT file by double clicking on it from the File Explorer.
		
		What is the type of public key method used:
		
		View the certificate file and determine:
		
		The size of the public key:
		
		The encryption method:

5 Hashing

http://youtu.be/Xvbk2nSzEPk

No	Description	Result

1	Using:
	
	`http://asecuritysite.com/encryption/md5`
	
	Match the hash signatures with their words (“Falkirk”, “Edinburgh”, “Glasgow” and “Stirling”).
	
	`03CF54D8CE19777B12732B8C50B3B66F`
	`D586293D554981ED611AB7B01316D2D5`
	`48E935332AADEC763F2C82CDB4601A25`
	`EE19033300A54DF2FA41DB9881B4B723`
		`03CF5:` Is it [Falkirk][Edinburgh][Glasgow][Stirling]?
		
		`D5862:` Is it [Falkirk][Edinburgh][Glasgow][Stirling]?
		
		`48E93:` Is it [Falkirk][Edinburgh][Glasgow][Stirling]?
		
		`EE190:` Is it [Falkirk][Edinburgh][Glasgow][Stirling]?

2	Using: `http://asecuritysite.com/encryption/md5` Determine the number of hex characters in the following hash signatures.	MD5 hex chars: SHA-1 hex chars: SHA-256 hex chars: How does the number of hex characters relate to the length of the hash signature:

3	Kali, for the following /etc/shadow file, determine the matching password:
	
	`bill:$apr1$waZS/8Tm$jDZmiZBct/c2hysERcZ3m1`
	`mike:$apr1$mKfrJquI$KxOCL9krmqhCu0SHKqp5Q0`
	`fred:$apr1$Jbe/hCIb$/k3A4kjpJyC06BUUaPRKs0`
	`ian:$apr1$0GyPhsLi$jTTzW0HNS4Cl5ZEoyFLjB.`
	`jane: $1$rqOIRBBN$R2pOQH9egTTVN1Nlst2U7.`
		The passwords are password, napier, inkwell and Ankle123.
		[Hint: openssl passwd -apr1 -salt ZaZS/8TF napier]
		
		Bill's password:
		
		Mike's password:
		
		Fred's password:
		
		Ian's password:
		
		Jane's password:

5	On Kali, download the following:
	
	`http://asecuritysite.com/files02.zip`
	
	and the files should have the following MD5 signatures:
	
	`MD5(1.txt)= 5d41402abc4b2a76b9719d911017c592`
	`MD5(2.txt)= 69faab6268350295550de7d587bc323d`
	`MD5(3.txt)= fea0f1f6fede90bd0a925b4194deac11`
	`MD5(4.txt)= d89b56f81cd7b82856231e662429bcf2`
		Which file(s) have been modified:

6	From your Kali, download the following ZIP file: `http://asecuritysite.com/letters.zip`	View the letters. Are they different? Now determine the MD5 signature for them. What can you observe from the result?

6 Hashing Cracking (MD5)

http://youtu.be/Xvbk2nSzEPk

No	Description	Result

1	On Kali, next create a words file (**words**) with the words of "napier", "password" "Ankle123" and "inkwell"
	
	Using hashcat crack the following MD5 signatures (hash1):
	`232DD5D7274E0D662F36C575A3BD634C`
	`5F4DCC3B5AA765D61D8327DEB882CF99`
	`6D5875265D1979BDAD1C8A8F383C5FF5`
	`04013F78ACCFEC9B673005FC6F20698D`
	
	Command used: `hashcat -m 0 hash1 words`
		`232DD...634C` Is it [napier][password][Ankle123][inkwell]?
		
		`5F4DC...CF99` Is it [napier][password][Ankle123][inkwell]?
		
		`6D587...5FF5` Is it [napier][password][Ankle123][inkwell]?
		
		`04013...698D` Is it [napier][password][Ankle123][inkwell]?

2	Using the method used in the first part of this tutorial, find crack the following for names of fruits (the fruits are all in lowercase):
	
	`FE01D67A002DFA0F3AC084298142ECCD`
	`1F3870BE274F6C49B3E31A0C6728957F`
	`72B302BF297A228A75730123EFEF7C41`
	`8893DC16B1B2534BAB7B03727145A2BB`
	`889560D93572D538078CE1578567B91A`
		`FE01D:`
		
		`1F387:`
		
		`72B30:`
		
		`8893D:`
		
		`88956:`

7 Hashing Cracking (LM Hash/Windows)

All of the passwords in this section are in lowercase. http://youtu.be/Xvbk2nSzEPk

No	Description	Result

1	On Kali, and using John the Ripper, and using a word list with the names of fruits, crack the following pwdump passwords:
	
	`fred:500:E79E56A8E5C6F8FEAAD3B435B51404EE:5EBE7DFA074DA8EE8AEF1FAA2BBDE876:::`
	`bert:501:10EAF413723CBB15AAD3B435B51404EE:CA8E025E9893E8CE3D2CBF847FC56814:::`
		Fred:
		Bert:

2	On Kali, and using John the Ripper, the following pwdump passwords (they are names of major Scottish cities/towns):
	
	`Admin:500:629E2BA1C0338CE0AAD3B435B51404EE:9408CB400B20ABA3DFEC054D2B6EE5A1:::`
	`fred:501:33E58ABB4D723E5EE72C57EF50F76A05:4DFC4E7AA65D71FD4E06D061871C05F2:::`
	`bert:502:BC2B6A869601E4D9AAD3B435B51404EE:2D8947D98F0B09A88DC9FCD6E546A711:::`
		Admin:
		Fred:
		Bert:

3	On Kali, and using John the Ripper, crack the following pwdump passwords (they are the names of animals):
	
	`fred:500:5A8BB08EFF0D416AAAD3B435B51404EE:85A2ED1CA59D0479B1E3406972AB1928:::`
	`bert:501:C6E4266FEBEBD6A8AAD3B435B51404EE:0B9957E8BED733E0350C703AC1CDA822:::`
	`admin:502::333CB006680FAF0A417EAF50CFAC29C3:D2EDBC29463C40E76297119421D2A707:::`
		Fred:
		Bert:
		Admin:

Repeat all 7.1, 7.2 and 7.3 using **Ophcrack**, and the rainbow table contained on the instance (rainbow_tables_xp_free).

8 Python tutorial

In this lab we will encrypt a string with a public key, and the decrypt with the private key.

📖 **Web link (Cipher code):** https://asecuritysite.com/encryption/rsa12

The code should be:

```
from Crypto.Util.number import *
from Crypto import Random
import Crypto
import gmpy2
import sys

bits=60
msg="Hello"

p = Crypto.Util.number.getPrime(bits, randfunc=Crypto.Random.get_random_bytes)
q = Crypto.Util.number.getPrime(bits, randfunc=Crypto.Random.get_random_bytes)

n = p*q
PHI=(p-1)*(q-1)

e=65537
d=(gmpy2.invert(e, PHI))

m=  bytes_to_long(msg.encode('utf-8'))

c=pow(m,e, n)
res=pow(c,d ,n)

print "Message=%s\np=%s\nq=%s\nN=%s\ncipher=%s\ndecipher=%s" % (msg,p,q,n,c,(long_to_bytes(res)))
```

Prove the operation of the code. Now, try with 128-bit prime numbers and 256-bit prime numbers. What can you observe from the increase in the prime number size?

Can you integrate a timer in your code, so that you can assess the time to encrypt and decrypt? Now complete the following table:

Prime number size	**Time to generate primes**	**Time to encrypt**	**Time to decrypt**
60			
128			
256			

We can write a Python program to implement this key exchange. Enter and run the following program:

```
import random
import base64
import hashlib
```

```
import sys

g=11
p=1001

x=random.randint(5, 10)

y=random.randint(10,20)

A=(g**x) % p

B=(g**y) % p

print 'g: ',g,' (a shared value), n: ',p, ' (a prime number)'

print '\nAlice calculates:'
print 'a (Alice random): ',x
print 'Alice value (A): ',A,' (g^a) mod p'

print '\nBob calculates:'
print 'b (Bob random): ',y
print 'Bob value (B): ',B,' (g^b) mod p'

print '\nAlice calculates:'
keyA=(B**x) % p
print 'Key: ',keyA,' (B^a) mod p'
print 'Key: ',hashlib.sha256(str(keyA)).hexdigest()

print '\nBob calculates:'
keyB=(A**y) % p
print 'Key: ',keyB,' (A^b) mod p'
print 'Key: ',hashlib.sha256(str(keyB)).hexdigest()
```

Pick three different values for g and p, and make sure that the Diffie Hellman key exchange works:

g= p=
g= p=
g= p=

Can you pick a value of g and p which will not work?

The code given below allows you to pick a value of g which will always work for a given value of p. Can you integrate the code and prove that it works?

https://asecuritysite.com/encryption/pickg

```
def getG(p):

  for x in range (1,p):
        rand = x
        exp=1
        next = rand % p

        while (next <> 1 ):
                next = (next*rand) % p
                exp = exp+1

        if (exp==p-1):
                print rand

print getG(p)
```

Using the prime number generates given in the RSA code, can you implement a Diffie-Hellman method which uses 256 bit prime numbers?
